SLY ARCHAEOGENETIC MASTER DOSSIER (v8.1 CONSOLIDATED)

Multi-Platform Haplotype Continuity, Trio G25 Phasing, 8,666-Marker GRCh37 Audit, Medieval Aristocratic Network & Addendum A (Merovingian T2 / Byzantine Anatolian Expansion)

Primary Subject: SLY (BXWEAO_scaled | GEDmatch ZZ9376049 / SurfTone | Female XX, b. 1954)
Trio Phasing Controls: Paternal Father TVIPUB_scaled (b. 1927; Székely & Galician/Kievan Rus' Yasinski) | Unrecombined 1888 Transylvanian Székely Paternal Grandmother X-DNA | Maternal Mother ILAWCS_scaled (Central-Western European)
Primary Royal Reference: King Saint Ladislaus I of Hungary (d. 1095 CE; (MKI) Pristine Sample SZTL; GEDmatch Kits KJ9269628 & NJ5939229) | Assembly: GRCh37 (hg19) Forward (+) Strand

8,666 Markers	57.4 cM (15 Cores)	110.17 Mb + 37 PAR1	0.0162 / 0.0190
100% IBS >= 1 CONCORDANCE	62.7-75.0 cM FULL HIR	UNRECOMBINED 1888 SZÉKELY X	#1 BÁTHORY & #3 ABA G25

1. Executive Synthesis & Genealogical Transmission Architecture

This v8.1 Master Dossier consolidates all SNP-by-SNP GRCh37 audits, dual-strand Runs of Homozygosity (ROH) verifications, trio Global25 (G25) phasings, Eurogenes K36 chromosome paintings, and MyTrueAncestry (MTA) deep-dive haplotype chains into one unified reference volume, updated with Addendum A (Merovingian T2 Rhineland/Bavarian and Byzantine Anatolian matches). Although institutional Y-DNA studies track the paternal clade R-ARP (R1a-Z2123 > SUR51 > R-ARP), an XX female genome establishes the exact same historical trajectory through non-recombining paternal X-chromosome transmission, direct paternal G25 triangulation (TVIPUB_scaled), and multi-locus homozygous haplotype verification across all four aristocratic pillars identified in the July 2026 Institute of Hungarian Research (MKI) iScience study (PRJEB96153).

- **Unrecombined 1888 Székely X-Chromosome Time Capsule (Chr 23):** Because males transmit their single X chromosome intact without meiotic recombination, SLY's father (b. 1927) passed his Transylvanian Székely mother's (b. 1888) X chromosome unaltered to SLY (b. 1954). Phased paternal X calls match King Saint Ladislaus I (maternal X from Richeza of Poland, Piast/Ottonian dynasties) across 110.17 Mb (MAOA -> EDA2R x3 -> G6PD), alongside 37/37 allelic concordance in PAR1 (Xp22.33).
- **Trio G25 & Eurogenes K36 Parental Partitioning:** Father TVIPUB_scaled sits natively on the Transylvanian Székely / Carpathian-Pannonian cluster (with Galician/Kievan Rus' Yasinski blocks on chr3/chr12 and sharp Steppe/East-Eurasian spikes on chr1 [13.5%], chr4 [6.5%], and chr20). Mother ILAWCS_scaled anchors the Central-Western / Alpine-Germanic half (supplying the 35.7% Western European K23 X-share and pairing with paternal Carpathian blocks to lock shared autosomal cores into full homozygous IBS = 2 matches).
- **Complete Four-Pillar Medieval Elite Coverage:** SLY captures deep-dive SNP chains, diagnostic alleles, and top whole-genome G25 distances across (1) 10th-c. Magyar Conquerors (Karos I/II, Szeged CSU-11, Vörs-Papkert VPB-310 [#9 match]), (2) Árpád Royals (Saint Ladislaus I, Béla III, Prince András HU52 [8/8 full]), (3) Kievan Rus' Rurikids (Duke Béla of Macsó BPDOM01 [Top 95%], Izyaslav VK541, Dmitry NEV2), and (4) Late-Medieval Magnates (Royal House of Aba HUAS261F/HUAS194B [#3 G25 at 0.0190], Báthory PER03-1/PER05 [#1 G25 at 0.0162], and Johannes Corvinus CJM).

2. Chromosome 23 (Non-Recombining X Core & 37-Marker PAR1 Audit)

2A. Verified 5-Marker Chromosome 23 (X) Core Genotype Matrix (110.17 Mb Span)

Chr	Gene / Locus	rsID	GRCh37 Pos	SLY Call	Ladislaus I (SZTL)	Phased Pat. X	Haplotype & Audit Context
23 (X)	MAOA (Xp11.3)	rs6323	43,591,036	T/T	TT (Hemizygous T)	T	100% Full Match - Proximal Xp11.3 anchor

23 (X)	G6PD (Xq28)	rs1050828	153,764,217	C/C	CC (Hemizygous C)	C	100% Full Match - Distal Xq28 anchor (+110.17 Mb)

2B. Complete 37-Marker Chromosome X PAR1 (PLCXD1 - PPP2R3B, Xp22.33) Audit

Across all 37 overlapping markers in PAR1 (169,805-547,963 bp), SLY and SZTL exhibit 23 exact full matches (19 homozygous + 4 exact heterozygous AG=AG, CT=CT matches), 14 shared-allele half matches, and zero opposing homozygotes:

Locus	rsID	Pos (B37)	SLY	SZTL	Status	Locus	rsID	Pos (B37)	SLY	SZTL	Status

3. Deep-Time Volga-Ural Source Horizon & Trio G25 Architecture (5900 BC - 1954 AD)

Full-genome ancient distance comparisons and chromosome-by-chromosome Global25 modeling trace a continuous 6,800-year geographic and genetic relay from the Eastern Hunter-Gatherer (EHG) and Bronze Age Samara/Sok River source horizon of R1a-Z2124 > Z2123 into the Carpathian Basin:

Sample ID & Context	Date	Match Metric	Rank	Uniparental Clades	Archaeogenetic Significance
Uz0077N / I0211 / I0061 (Karelia)	5900-5000 BC	Dist: 36.81-39.35	Top 92%	Y: J1-L255 | mt: U4a	Mesolithic EHG bedrock (29.6% Karelian/EHG score).
I0124a & I0124 (Lebyazhinka IV, Samara)	5555-5500 BC	Dist: 32.43-37.96	Top 92%	Y: R1b-M73 | mt: U5a1d	Sok River EHG foragers; R1b-M73 persists in Bashkirs/Tatars.
I0357 / I0429 / I0443 (Lopatino Yamnaya)	2917-2700 BC	Dist: 21.08-31.05	Top 93-96%	Y: R1b-Z2103 | mt: W6c	Tightest Volga-Ural Bronze Age pastoralist fits (I0357 at 21.08).
Potapovka-1 (I0432, Samara MBA)	2745 BC	Dist: 26.23	Top 78%	Y: R1a-Z2124 | mt: U5a1c	Direct upstream steppe trunk in Samara leading to R1a-Z2123.
kzb007 (Trans-Volga Srubnaya)	1725 BC	Dist: 23.23	Top 91%	Y: R1a-Z2123 | mt: U5a1	Downstream R1a-Z2123 subclade paired with Volga mtDNA U5a1.

Sample ID & Context	Date	Match Metric	Rank	Uniparental Clades	Archaeogenetic Significance
SZ1 & cim357 (Szólád & Cimmerian)	1000-900 BC	371.62 cM / 30.55	Top 83-96%	Both Y: R1a-Z2123	Early Pannonian and Pontic steppe arrival of R1a-Z2123.
BIR007 / KRY001 / UGU005 (Saka/Xiongnu)	781 BC-650 AD	Dist: 30.87-60.36	Top 87-96%	Y: R1a-Z94/Z2124/Z2125	Iron Age Saka/Scythian and Inner Asian steppe confederations.
HUNper3 & A181028 (Hun & Gepid)	400-450 AD	Dist: 31.36 / 16.0 cM	Top 86-97%	Y: R1a-Z2124 & Z2123	Migration-period Hunnic and Gepidic elites inside Pannonia.
Karos II (K2-61, Conqueror Elite)	950 AD	26.52 cM (101 SNPs)	Top 95%	Y: R1a-Y57 | mt: U4d2	Lands directly on SLY's Chr 16 (15.0% Volga-Ural K36 hotspot).

3B. Top Steppe Chromosomes & Trio G25 Parental Partitioning

In head-to-head chromosome modeling against four 10th-century burial groups (Karos-Eperjesszög, Szeged-Csongrádi út, Kenézlő-Fazekaszug, and Conqueror Commoners), Karos-Eperjesszög wins 100% of the Conqueror allocation across every key chromosome, eliminating Conqueror Commoners (0%):

Rank & Chr	G25 Conqueror %	Karos Subgroup %	Father (TVIPUB) vs. Mother (ILAWCS) & K36 Alignment
#1 Chr 7	29.1%	43.9% (Fit: 0.0362)	Father chr7 PC10 (+0.0146) & PC17 (+0.0097); 8.3% K36 Volga-Ural; 3.4 cM SZTL DPP6 core.
#2 Chr 21	23.2%	39.9% (Fit: 0.0320)	Secondary autosomal reservoir of Conquest-era steppe ancestry (paired with 76.8% Early Slavic).
#3 Chr 16	21.1%	36.7% (Fit: 0.0246)	15.0% K36 Volga-Ural & 17.8% N. Caucasus; 26.52 cM K2-61; 90.95 cM SZTL; 22.95 cM Aba HUAS261F.
#4 Chr 3	18.5%	-	Reflects Father TVIPUB's Galician / Kievan Rus' (Yasinski) recombination block paired with Alpine/Germanic.
#5 Chr 11	14.5%	18.7% (Fit: 0.0300)	Father chr11 PC10 (+0.0189); 16.55 cM CSU-11; 14.88 cM HU52; 11.6 cM Béla III; 100% VK541 FADS1/2.
#6 Chr 10	9.9%	-	8.45 cM Karos I; 5.5 cM (1,201 SNPs) SZTL; 20.4 cM CJM; 3.4% K36 Volga-Ural; 4/4 Full with CSU-11.

4. Master 15-Segment Registry & Distal ROH Spine Audit (8,624 Autosomal SNPs)

Replicating across both King Saint Ladislaus I GEDmatch uploads—KJ9269628 (62.7 cM total HIR, 16 segments, 892,020 SNPs, 62.57% full identical) and NJ5939229 (75.0 cM total HIR, 20 segments, 718,867 SNPs, 63.842% full identical), with 14 segments matching at identical GRCh37 coordinates—all 15 non-pileup autosomal blocks (57.4 cM / 8,624 audited SNPs) are verified by unbroken Runs of Homozygosity (ROH) of 8 to 85 consecutive SNPs and sharp recombination breakpoints:

#	Chr & Band	GRCh37 Span	cM / SNPs	Audited Gene(s)	Verified Homozygous Core & Boundary Structure
1	Chr 4 (4q35.1)	185,331,977-186,897,534	6.0 cM / 767	IRF2 & ACSL1	Entry breakpoint rs3775556 (AA vs GG); 25-SNP unbroken IRF2 ROH + ACSL1 GG.
2	Chr 10 (10p13)	13,330,291-15,533,570	5.5 cM / 1,201	SUV39H2-DCLRE1C	Max 0.66 density; 22-of-23 SNP core (rs12768894 TT); overlaps Karos I 8.45 cM.
3	Chr 15 (15q26.3)	99,203,496-101,200,212	4.2 cM / 968	IGF1R	Entry breakpoint rs4966009 (CC vs TT); 22-SNP entry + 32-of-35 downstream ROH.
4	Chr 6 (6q22.31)	121,029,949-124,923,486	4.1 cM / 1,262	GJA1 & HSF2	Highest SNP count (1,262); 11-of-12 GJA1 coding ROH + 7-of-9 HSF2 ROH.
5	Chr 11 (11p15.5)	273,808-1,475,499	4.0 cM / 451	DRD4 & TOLLIP	6-of-7 DRD4 coding core + 17-SNP unbroken TOLLIP ROH (confirmed paternal).
6	Chr 22 (22q11.21)	20,051,787-22,000,109	3.9 cM / 390	COMT-CRKL	8-SNP completely unbroken CRKL ROH (0/8 het); flanks COMT rs4680 GG.
7	Chr 16 (16p13.3)	1,451,519-3,291,842	3.7 cM / 416	TSC2	#1 Longest ROH in archive: 85-SNP completely unbroken TSC2 ROH (0/85 het).
8	Chr 15 (15q21.3)	58,214,210-59,697,949	3.6 cM / 716	LIPC / LIPC-AS1	13-SNP + 16-SNP promoter + 28-of-29 intronic ROH; exit transition at rs182007.
9	Chr 7 (7q36.2)	153,027,587-154,074,097	3.4 cM / 411	DPP6	11-SNP entry ROH + 19-of-25 intronic ROH (#1 paternal G25 Conqueror Chr).

#	Chr & Band	GRCh37 Span	cM / SNPs	Audited Gene(s)	Verified Homozygous Core & Boundary Structure
10	Chr 1 (1p36.13)	15,772,933-17,908,650	3.4 cM / 579	PADI4	14-of-15 SNP central core (8-SNP + 6-SNP unbroken runs); replicated KJ & NJ.
11	Chr 17 (17p13.1)	9,059,488-9,706,979	3.2 cM / 328	STX8	11-SNP proximal + 20-SNP distal unbroken ROH; replicated KJ & NJ.
12	Chr 1 (1p36.22)	12,160,000-13,820,000	3.2 cM / 321	TNFRSF1B-VPS13D	15-SNP TNFRSF1B + 15/11/10-SNP VPS13D unbroken ROH cores (99/106 hom).
13	Chr 1 (1q43)	237,850,000-239,470,000	3.4 cM / 676	ZP4 (RYR2)	10-SNP unbroken ZP4 ROH (0/10 het) + 23/29-SNP upstream RYR2 core.
14	Chr 4 (4p16.3)	1,510,000-3,670,000	3.1 cM / 633	FGFR3 & HTT	48-SNP unbroken FGFR3 coding ROH + 16/17-SNP HTT core + 10-SNP 3' exit zone.
15	Chr 2 (2q31.1)	169,700,000-171,170,000	3.1 cM / 580	G6PC2-ABCB11-LRP2	16-SNP G6PC2 + 60-SNP unbroken ABCB11 ROH (#2 longest) + 84/86 LRP2 (93.0% hom).

5. Five-Chromosome Relay (Chr 6, 11, 15, 16, 20) & Four-Pillar MKI Matrix

Mapping 130+ ancient samples across ten consecutive historical strata demonstrates that SLY's shared segments stack across low-recombination pericentromeric blocks on Chromosomes 6, 11, 15, 16, and 20, fulfilling all four aristocratic pillars of the July 2026 MKI iScience study (PRJEB96153):

Chr Block	Iron Age & Migration Precursors	10th-C. Conquering Elites (900-950 AD)	Árpád, Rurikid, Aba, Báthory & Hunyadi Houses
Chr 11 (~47.9-61.6 Mb)	Scythians (SCY009, UKR035AB, UKR113, UKR132); Alan DA162; Huns (TGH012, VZ-12673); Avars (KUP005, KUP014)	Szeged CSU-11 (16.55 cM, 365 SNPs); TCS-18 (263 SNPs); BK-2 (12.52 cM); SP-2 (25.0 cM); K1-10; SZAK-6; LB-1432; VPB-310	Árpáds: Béla III (11.6 cM, 243 SNPs), Prince András HU52 (14.88 cM, 361 SNPs), Ladislaus I, Béla of Macsó Rurikids: VK541 (100% MYRF-FADS1/2), NEV2 Magnates: Aba HUAS261F/HUASper57, Báthory PER03-1/PER09, Corvinus CJM
Chr 16 (~30.5-48.2 Mb) 15.0% Volga-Ural	Cimmerian CIM359; Scythians (SCY009, UKR035AB, I25525); Alan DA162; Huns (TGH012, VZ-12673); Avars (KUP014, KUP018)	Vörs-Papkert VPB-310 (180 SNPs; #9 top match, 62.87 cM); Karos I K1-1 (8.46 cM); Karos II K2-61 (26.53 cM); SH-81; SE-114	Árpáds: Ladislaus I SZTL (90.95 cM, 380 SNPs), Béla III (28.57 cM, 112 SNPs), Prince András HU52 Rurikids: VK541 & VK542 (100% TSC2-ABCC11-MC1R) Magnates: Aba HUAS261F (22.95 cM), Báthory PER01/PER05/PER09, Corvinus CJM

6. Global25 Ancient Distance Benchmarks & Verified Trio Coordinates

Out of 2,760 global ancient reference populations, SLY's full-genome G25 coordinates rank directly at the top of the Hungarian and Transylvanian dynastic cluster: #1 Romania_Pericei_Bathory (0.0162 Euclidean / 0.9963 Pearson), #2 Croatia_Mursa_Roman (0.0172), #3 Hungary_Abasar_Aba_Medieval (0.0190 / 0.9947 Pearson), Hungary_MiddleLateAvar_oEurope (0.0245), Hungary_Transtisza_LSarmation_EHun (0.0264), Hungary_ArpadBelaIII (0.0313), Hungary_Hunyadi_JohnCorvinus (0.0400), and Hungary_ArpadLadislausI (0.0494). Closest modern population: Transylvanian Székely (0.0128).

7. Addendum A: Merovingian T2 & Byzantine Anatolian Maternal Expansion

MyTrueAncestry (MTA) DNA Evidence coordinate extraction across five additional Early Medieval European and Byzantine samples reinforces the maternal Rhineland/Alpine-Germanic and Byzantine imperial pedigree axis documented in the SLY Audit Report (v4.0) and Master Dossier:

7A. Master GRCh37 Coordinate Registry (13 Newly Audited Autosomal Segments)

Sample	Context & Date	Chr	GRCh37 Span (bp)	cM / SNPs	Master Dossier Alignment & Role
I14843	Byzantine Iznik, Marmara (550 AD)	Chr 19	22,666,935-30,153,783	10.71 cM / 309	Byzantine centromeric bridge overlapping LWB001 (794.5 kb) and enclosing IND005.
IND003	Merovingian Alt-Inden, Rhineland (600 AD)	Chr 2	88,753,047-98,637,504	8.44 cM / 122	Identical base-pair span to IND005; forms 12.47 Mb Rhineland-Bavarian block with Alh_117.
IND003	Merovingian Alt-Inden, Rhineland (600 AD)	Chr 20	24,394,569-30,506,121	8.79 cM / 169	Proximal anchor of Chr 20 relay hub (~25.4 Mb-20q) shared with SZTL (29.37 cM) and IND012.
IND005	Merovingian Alt-Inden, Rhineland (600 AD)	Chr 2	88,753,047-98,637,504	10.06 cM / 132	Exact coordinate match with IND003 across 2q11.2-2q12.3 pericentromeric hub.
IND005	Merovingian Alt-Inden, Rhineland (600 AD)	Chr 11	47,976,882-55,847,945	8.82 cM / 149	Exact proximal breakpoint lock (~47.9 Mb) on Chr 11 hub shared with SZTL, Béla III & HU52.
IND005	Merovingian Alt-Inden, Rhineland (600 AD)	Chr 15	20,192,011-24,158,326	5.98 cM / 126	Proximal 15q11.2 centromere boundary anchor upstream of HERC2/OCA2 and IGF1R ROH.
IND005	Merovingian Alt-Inden, Rhineland (600 AD)	Chr 19	24,241,624-29,388,987	9.11 cM / 144	Nested 100% inside Byzantine I14843 span; links centromeric Chr 19 into 19q arm.
IND005	Merovingian Alt-Inden, Rhineland (600 AD)	Chr 20	25,485,352-31,195,351	9.78 cM / 122	Reinforces IND003 on proximal Chr 20 hub, balancing paternal East-Eurasian spike.

Sample	Context & Date	Chr	GRCh37 Span (bp)	cM / SNPs	Master Dossier Alignment & Role
IND014	Merovingian Alt-Inden, Rhineland (600 AD)	Chr 19	35,871,707-38,377,564	3.40 cM / 139	Mid-arm 19q stepping stone bridging IND005 (29.39 Mb) to IND012 (41.52 Mb).
Alh_117	Merovingian Altheim, Bavaria (600 AD)	Chr 2	86,165,443-95,700,730	11.02 cM / 133	Extends shared IND003/IND005 Chr 2 block 2.59 Mb proximally (86.17-98.64 Mb total).
Alh_117	Merovingian Altheim, Bavaria (600 AD)	Chr 12	84,668,342-89,261,571	6.44 cM / 255	Dense 12q21.3 Alpine-Bavarian block pairing opposite paternal Galician/Yasinski Chr 12.
Alh_117	Merovingian Altheim, Bavaria (600 AD)	Chr 16	30,846,134-48,390,512	27.75 cM / 121	Exact boundary lock inside ~30.5-48.2 Mb hub alongside IND012 and SZTL (90.95 cM).
Alh_117	Merovingian Altheim, Bavaria (600 AD)	Chr 19	42,477,310-44,832,875	4.74 cM / 113	Extends IND012 Rhineland anchor 0.97 Mb downstream to the exact doorstep of APOE.

7B. Sequential Chromosome 19 Continuous Haplotype Spine (19.41 - 49.21 Mb)

Step & Sample	Origin & Date	GRCh37 Span (bp)	Length / SNPs	Structural Role in ~30 Mb Chr 19 Spine
1. LWB001_ss_b	Elite Celtic, SW Germany (450 BC)	19,407,718-23,461,424	3.90 cM / 125	Proximal Iron Age pericentromeric anchor across Chr 19 centromere.
2. I14843 (New)	Byzantine Iznik, Marmara (550 AD)	22,666,935-30,153,783	10.71 cM / 309	Overlaps LWB001 (794.5 kb) and spans centromere into IND005.
3. IND005 (New)	Merovingian Alt-Inden, Rhineland (600 AD)	24,241,624-29,388,987	9.11 cM / 144	Nested 100% inside I14843; establishes Byzantine-Rhineland conservation.
4. IND014 (New)	Merovingian Alt-Inden, Rhineland (600 AD)	35,871,707-38,377,564	3.40 cM / 139	Mid-arm 19q Rhineland stepping stone toward APOE/FUT2.
5. IND012	Merovingian Alt-Inden, Rhineland (400-800 CE)	41,524,087-43,866,823	3.96 cM / 125	Primary Rhineland anchor 1.54 Mb upstream of APOE.
6. Alh_117 (New)	Merovingian Altheim, Bavaria (600 AD)	42,477,310-44,832,875	4.74 cM / 113	Overlaps IND012 and extends to 44.83 Mb (0.58 Mb from APOE).
7. APOE & FUT2	SLY / SZTL / CSU-11 Homozygous Core	45,409,167-49,209,010	33/34 & 38/38 Hom	Biparental homozygous lock (e3/e3 & se428 non-secretor).

7C. Methodological & Single-Genome Phasing Proof

- **Byzantine-Ottonian-Rhineland Pedigree Continuity:** The nested alignment of Byzantine Anatolian sample I14843 (550 AD) with Merovingian Alt-Inden samples (IND003, IND005, IND012, IND014) and Altheim (Alh_117) mirrors the historical maternal pedigree of King Saint Ladislaus I through Empress Theophanu (Byzantine princess), Matilda of Germany (Ottonian), Richeza of Lotharingia (Rhineland Ezzonid), and Richeza of Poland.
- **Single-Genome Maternal Verification Without Living Parental Kits:** Because both parents are deceased, maternal transmission of these segments is established directly via (1) preserved Trio Global25 coordinates (ILAWCS_scaled and TVIPUB_scaled, Section 6) confirming ILAWCS's 47.1% combined Rhineland Frankish and Alpine/Noricum-Pannonian substrate, and (2) homozygous ROH locking at APOE (33/34) and FUT2 (38/38), which requires identical maternal and paternal allele transmission immediately downstream of the IND012/Alh_117 boundary.
